

Task 6

Scenario

The HR department wants to ensure data integrity by automatically tracking employee salary changes and managing transactions safely.

Task

Part 1 – Create Triggers

1. Create an AFTER INSERT trigger to record newly added employees in an EmployeeAudit table.
2. Create an AFTER UPDATE trigger to log salary changes, including:
 - EmployeeID
 - Old Salary
 - New Salary
 - Updated Date
3. Create an AFTER DELETE trigger to record deleted employee details in the audit table.

Part 2 – Transactions

1. Write a transaction to update the salaries of multiple employees.
2. Use COMMIT if all updates are successful.
3. Use ROLLBACK if any update fails.
4. Add proper error handling using TRY...CATCH.

Part 3 – Final Report

Write SQL queries to:

1. Display all employee salary change history.
2. Display employees whose salaries have been updated more than once.
3. Show the latest salary update for each employee.
4. Display the total number of insert, update, and delete operations recorded in the audit table.

Deliverables

- A single SQL script file (Day6_SQL_Task.sql) containing all triggers, transactions, and queries.
- Screenshots (or exported results) of the execution and query results.
- A short document (1–2 pages) explaining the implementation and observations.

Expected Completion Time: 1 day.
